Execution control for AI in production

Supporting brief for the email we sent: background only, not a request for a decision from this page.

1. Why this exists

Enterprises are moving from experiments to **agents that act**: they spend budget, access data, invoke tools, and change customer-facing state. The hard gap is **runtime control**—who approved what ran, and **what you can prove** afterward to finance, security, and auditors.

Connector is a self-hosted **governance and execution layer** between agents and production: policy, budgets, traces, and receipts at the action boundary—not a chat product or “prompt tuning” alone.

2. Isolate, govern, verify

Isolate	Scoped boundaries and access so roles and data do not blend blindly.
Govern	Policy, budget, and tools evaluated at runtime ; violations blocked, not only logged after the fact.
Verify	Tamper-evident audit semantics and content-addressed evidence— artifacts for review , not log dumps.

Same operator idiom as serious infra: **trace** → **explain** → **prove** (API and shell).

3. Capabilities

- Mediates **tool calls and side effects** so nothing bypasses policy silently at the runtime boundary.
- Ties **cost and risk** to decisions and traces, not only aggregate vendor spend.
- **Deploys beside** existing stacks—control at the edge first; no full toolchain rip-and-replace on day one.

4. Architecture & stage

Stack: agent OS-style layers (memory and packets at a boundary; action authorization; governed compile/execute). We focus the **write path**—where agents commit state, spend, and obligation—with deterministic operational discipline around model steps, bounded by policy and recorded as proof.

Controlled beta: runtime and workflows in self-hosted settings; design partners under real agent, tool, and compliance pressure. We understate distribution; we stand behind a **clear thesis and an implementation aligned to it**.

5. Follow-on

The email asked whether a short call makes sense **if** this fits your thesis. If yes, we walk one governed workflow end-to-end and discuss limits openly; if not, a quick pass is enough.
